

BL205 OPC UA Distributed I/O

BL205 User Manual

Version: V1.2

Date: 2023-10-24

Shenzhen Beilai Technology Co.,Ltd

Website: <https://www.bliiot.com>

Preface

Thanks for choosing BLIIoT Distributed I/O. These operating instructions contain all the information you need for operation of BL205.

Copyright

This user manual is owned by Shenzhen Beilai Technology Co., Ltd. No one is authorized to copy, distribute or forward any part of this document without written approval of Shenzhen Beilai Technology. Any violation will be subject to legal liability.

Disclaimer

This document is designed for assisting user to better understand the device. As the described device is under continuous improvement, this manual may be updated or revised from time to time without prior notice. Please follow the instructions in the manual. Any damages caused by wrong operation will be beyond warranty.

Revision History

Update Date	Version	Description	Owner
2021-10-13	V1.0	First Edition	ZLF
2022-07-01	V1.1	Add Profinet, EtherCAT protocol, add platform, logic control functions	HYQ
2023-07-27	V1.1	Change Model name	HYQ
2023-10-24	V1.2	Add BL203, BL206, BL207 description	HYQ

1 Product Introduction

1.1 Overview

BL205 controller is a data acquisition and control system based on a powerful 32-bit microprocessor design with Linux operating system, supports OPC UA protocol for quick access to on-site PLC, SCADA, and ERP systems.

The I/O system supports programmable logic control, edge computing, and customized applications, it is widely applicable to a variety of IIoT and industrial automation solutions.

The BL205 I/O system consists of 3 parts: Controller, I/O modules and terminal module.

The communication between the node and the field devices (eg PLC) takes place via the Ethernet interface of the fieldbus coupler, and the communication between the fieldbus coupler and the I/O modules takes place via the local bus. The two Ethernet interfaces are internally integrated with a switch function, which can establish a linear topology without the need for additional switches or hubs.

The system needs to use the power module to provide 24VDC system voltage and 24VDC field voltage. Since two independent power supplies are used, the field voltage input interface and system voltage input interface of BL205 controller are electrically isolated from each other.

When assembling fieldbus node modules, each I/O module can be arranged in any combination, and it is not required to be grouped by module type.

A terminal module must be plugged into the end of a fieldbus node to ensure correct data transmission.

1.2 Typical Application

High reliability, easy expansion, easy setting, and convenient network wiring, these capabilities let users efficiently adapt the BL205 I/O system to a variety of complex industrial solutions.

The I/O system is widely applicable to a variety of industrial solutions, such as Internet of Things, smart factories, smart cities, smart medical care, smart homes, smart transportation, data center power environment monitoring, electric power, oil monitoring, automobiles, warehousing and logistics and other industries.

1.3 Features

- Each I/O system can have a maximum of I/O 32 modules.
- Support OPC UA server.
- Support programmable logic control, edge computing.
- The field side, the system side and the bus side are electrically isolated from each other.
- Support 2 X RJ45 interface, integrated switch function, can establish line topology, without the need for additional switches or hubs.
- Convenient wiring connection technology, screw-free installation.

2 Hardware

2.1 EdgeIO Controller

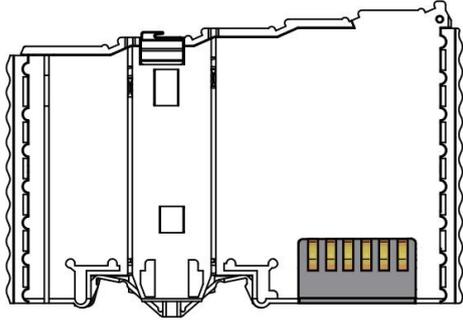

2.2 Dimension

Unit:mm

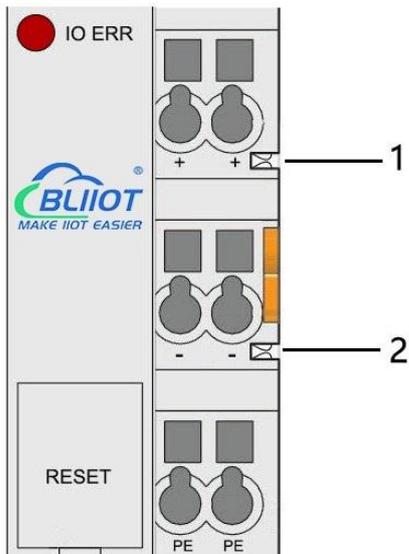

2.3 Data Contacts/Internal Bus

The communication between the I/O controller and the I/O modules, as well as the system power supply of the I/O modules are realized via the internal bus. The internal bus is made up of 6 data contacts, these gold-plated contacts are self-cleaning when connected.

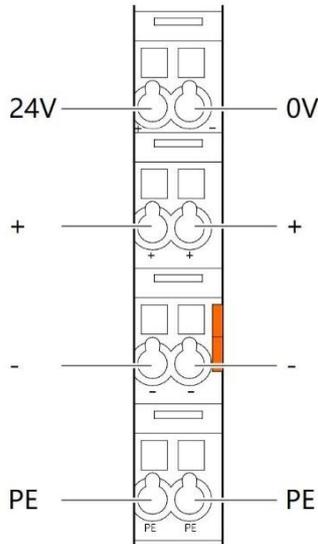

2.4 Power Jumper Contacts

The power module included with the coupler has two self-cleaning power jumper contacts for powering the field side. This power supply has a maximum current of 10A across the contacts, current exceeding the maximum will damage the contacts. When configuring the system, it must be ensured that the above-mentioned maximum current is not exceeded. If it exceeds, a power expansion module needs to be inserted.

No.	Type	Description
1	Spring contact	Supply 24V to the field side
2	Spring contact	Supply 0V to the field side

2.5 Terminal Point

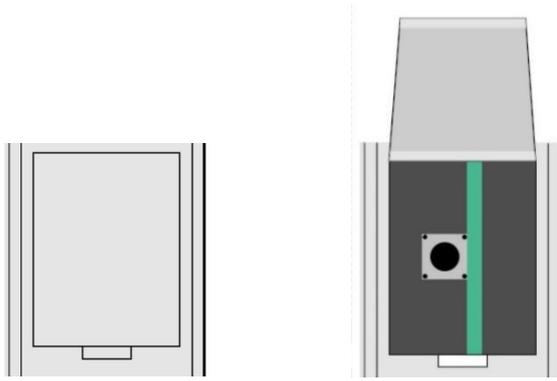

Name	Description
24V	System Power 24VDC
0V	System Power 0VDC
+	Connections Field Supply 24 VDC
+	Connections Field Supply 24 VDC
-	Connections Field Supply 0 VDC
-	Connections Field Supply 0VDC
PE	Grounding
PE	Grounding

2.6 Factory Reset

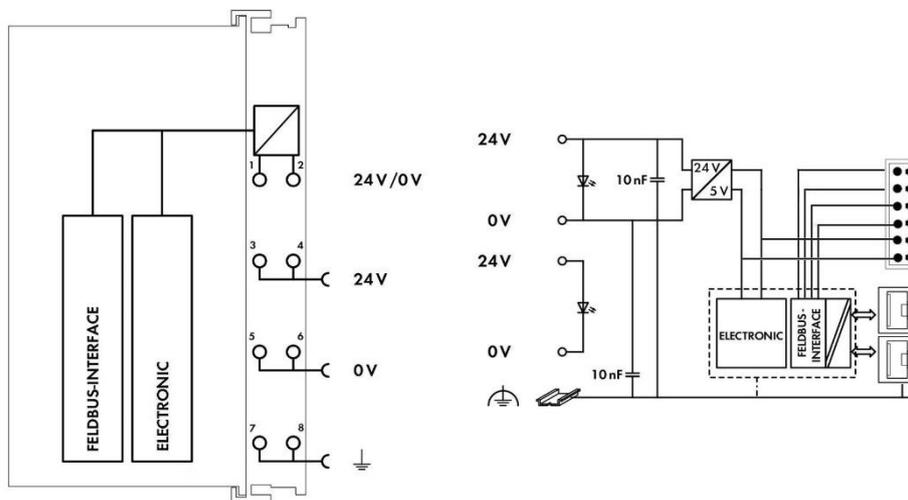

This reset button is used to restore the device configuration parameters to the factory state.

Operation steps:

1. When the device is running, open the flip cover;
2. Press and hold the button for more than 5 seconds, until all the LED lights go off, indicates reset successful, and then the device will automatically restart.

2.7 Electrical Schematic

3 Installation

3.1 Installation Sequence

All distributed I/O controllers and I/O modules from Beilai Technology must be mounted on a standard DIN 35 rail.

Starting from the coupler, the I/O modules are assembled from left to right, and the modules are installed next to each other. All I/O modules have grooves and power jumper contacts on the right side, to avoid assembly errors, I/O modules must be inserted from the right and top to avoid damage to the modules.

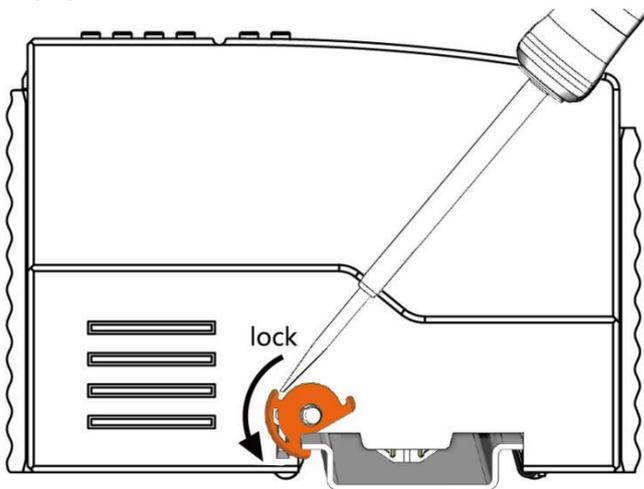

Utilizes a tongue and groove system to form a secure fit and connection. With the automatic locking function, the individual components are securely fixed on the rail

after installation.

Don't forget to install the terminal module! Always plug a terminal module (eg TERM) into the end of the I/O module to ensure correct data transmission.

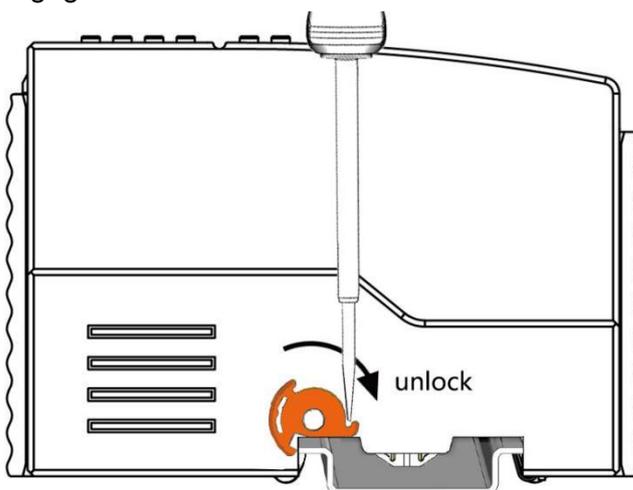

3.2 Install Controller

- 1.Snap the controller onto the DIN rail first;
- 2.Use a tool such as a screwdriver to turn the locking cam until the locking cam engages the DIN rail.

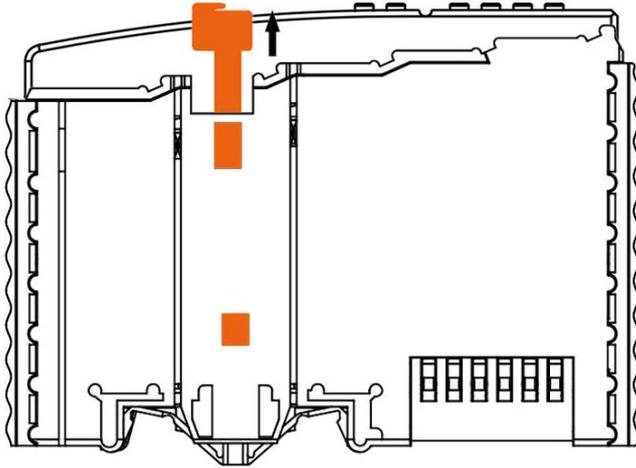

3.3 Remove Controller

- 1.Use a screwdriver to turn the locking disc cam until the locking cam no longer engages the rail.

- 2.Pull the release tab to remove the controller from the assembly

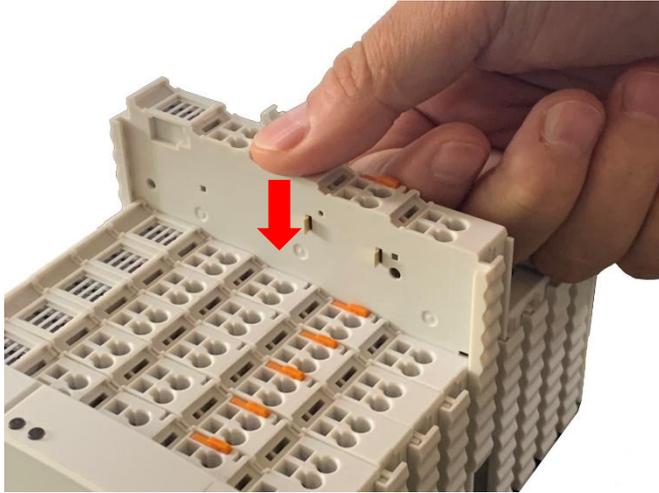

Data or power contacts are electrically disconnected from adjacent I/O modules when the controller is removed.

3.4 Insert I/O Modules

1. When inserting the module, make sure the tabs on the module line up with the grooves of the coupler or other I/O module to which it is attached.

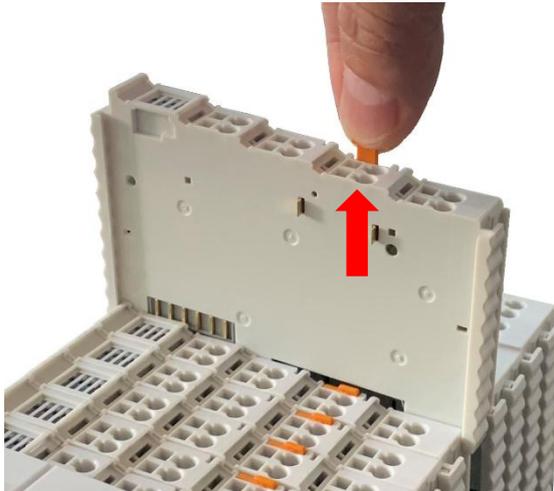

2. Press the I/O module into the assembly position until the I/O module snaps into the rail.

After the I/O module is installed, the electrical connection to the controller (or the previous I/O module) and the following I/O module is established via the data contacts and the power jumper contacts.

3.5 Remove I/O Modules

Pull up on the latch to remove the I/O module from the assembly.

When the I/O module is removed, the electrical connection to the data or power jumper contacts is disconnection.

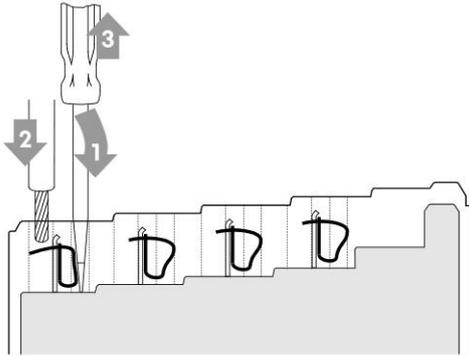

4 Device Connection

4.1 Wiring

CAGE CLAMP connection is suitable for solid, stranded and fine-stranded conductors. Only one wire can be connected to each CAGE CLAMP. If there is more than one wire,

it must be merged into a point before being connected.

1. Open the CAGE CLAMP by inserting the tool into the opening above the junction.
2. Insert the wire into the corresponding open connection terminal.
3. Once the tool is removed, the CAGE CLAMP closes and the wire is clamped firmly by the spring.

4.2 Power Supply

System and field voltages are supplied by power supply modules. The power supply module of the BL205 controller supplies power for the internal electronics of the controller and the I/O modules. If necessary (there are many I/O modules and the current is relatively high), it can also be provided through an independent power supply module.

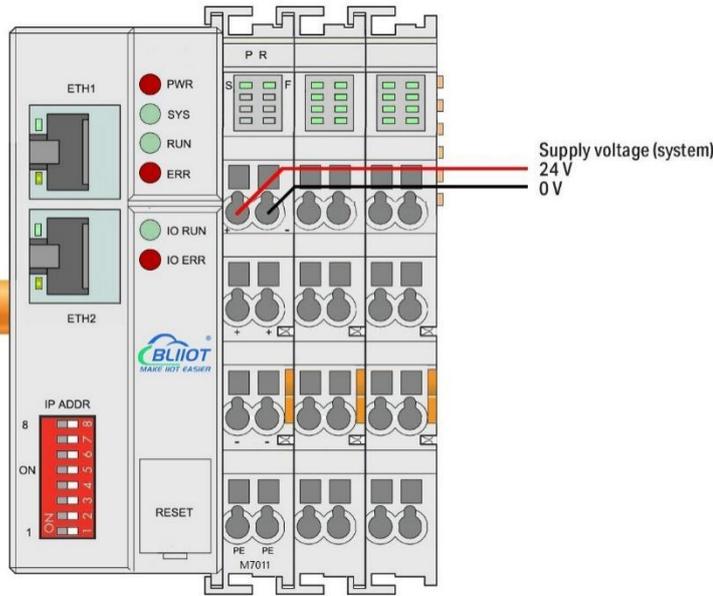

The fieldbus interface (Ethernet interface), system and field are galvanically isolated from each other.

4.2.1 System Power

BL205 controller require 24V DC system power, which is connected from the terminal of the power supply module. The 5V bus voltage required inside the system is converted from the 24V system voltage.

The power supply module only has proper fuse protection, please provide proper overcurrent protection externally.

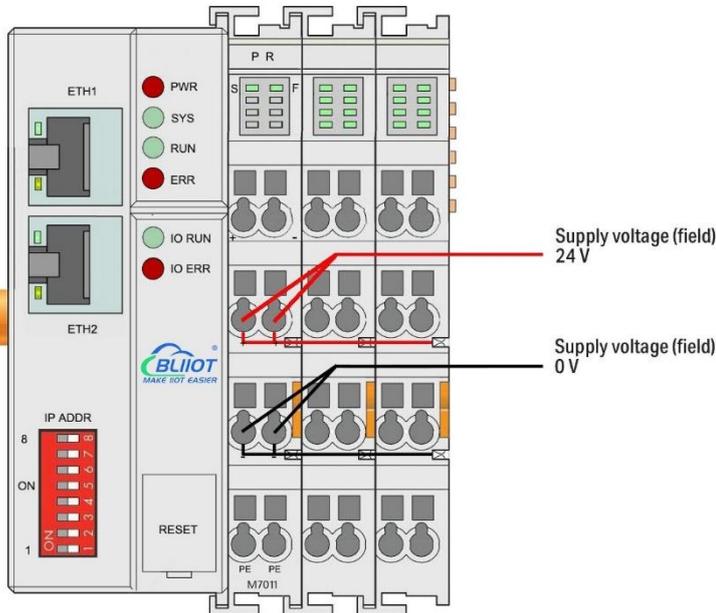

Please pay attention to matching the output power of the power supply module and the load power to avoid excessive load current.

4.2.2 On-site Power Supply

The power supply module supplies 24 VDC on the field side to power the sensors and actuators.

Field power supply only has proper fuse protection. Without overcurrent protection, electronic equipment can be damaged.

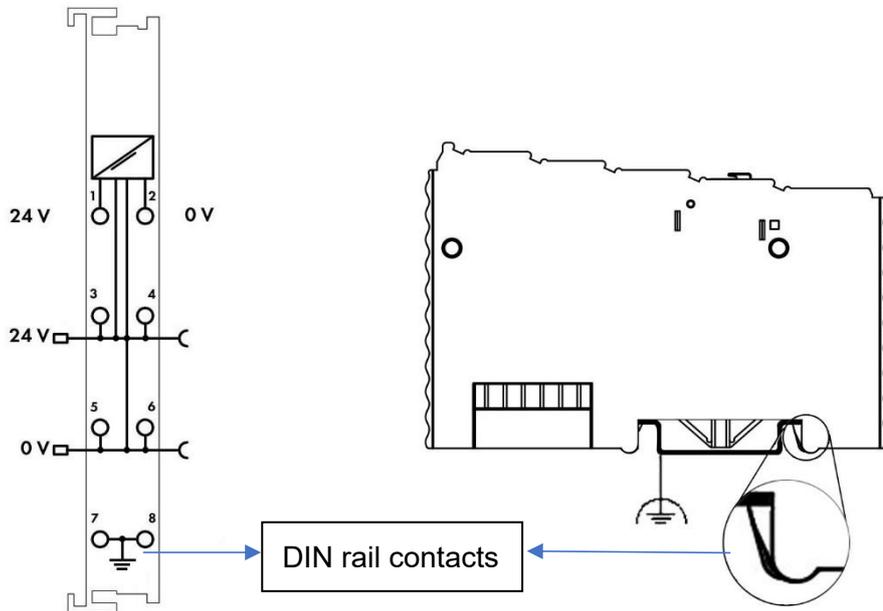

Field-side power is automatically output from the power jumper contact when the I/O module is connected. The continuous load current across the contacts of the power supply must not exceed 10 A.

The problem of excessive load power on the system side or on the field side can be

solved by plugging in additional power supply modules. After plugging in an additional power supply module, a new voltage potential may appear on the field side. In the case where electrical isolation is not required, the field power supply and the system power supply can use the same power supply.

4.2.3 Grounding

When installing the enclosure cabinet, the cabinet must be grounded, and the rail is electrically connected to the cabinet through screws to ensure that the rail is properly grounded. Grounding can increase resistance to electromagnetic interference. Some components in the I/O system have rail contacts that dissipate EMI onto the rail.

5 BL205 OPC UA EdgeIO Controller

5.1 BL205 Overview

The BL205 controller supports the OPC UA Server function and provides data as a server. Conforms to the IEC 62541 industrial automation unified architecture communication standard, and the data can be transmitted by encryption (X.509 certificate) and identity verification. The security policy supports basic128rsa15, basic256, basic256sha256, aes128sha256rsaoaep, can choose signature or

signature and encryption. Supports the custom information model, and can fill in up to 5 reference models.

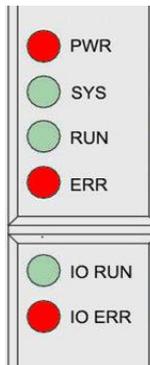

5.2 Technical Parameters

Name	Parameters	Description
System power	Input voltage(system)	24 VDC
	Input current(system)	MAX 500 mA@24VDC
	Power Efficiency	84%
	Internal bus voltage	5VDC
	Controller current consumption	MAX 300mA@5VDC
	I/O current consumption	MAX 1700mA@5VDC
	Isolation protection	500 V system/supply
Field power	Input voltage (field)	24 VDC
	Current carrying capacity (power jumper contacts)	MAX 10 ADC
Ethernet	Number	2 X RJ45
	Transmission medium	Twisted Pair STP 100 Ω Cat 5
	MAX cable length	100m
	Baud rate	10/100 Mbit/s
	Isolation protection	ESD contact 8KV, Surge 4KV(10/1000us)
System	Operating system	Linux
	CPU	300MHz
	RAM	64MB
	Flash	128MB
	Number of I/O modules	MAX 32
	Protocols	OPC UA , HTTP, DHCP, DNS
Wiring	Method	CAGE CLAMP
	Wire diameter	0.08 mm ² ... 2.5 mm ² , AWG 28 ... 14
	Strip length	8 mm ... 9 mm / 0.33 in
Environment	Working temperature	0 ... 55 °C
	Storage temperature	-40 ... 70 °C
	Relative humidity	5 ... 95% no condensation
	Working altitude	0 ... 2000 m
	Protection	IP20

Dimension	Width	48mm
	Length	100mm
	Height	69mm
Material	Color	Light gray
	Housing material	Polycarbonate, Nylon 6.6
	Fire load	1.239 MJ
	Weight	180 g
Installation	Method	DIN-35
Certificates	EMC	EN 55022: 2006/A1: 2007 (CE &RE) Class B
		IEC 61000-4-2 (ESD) Level 4
		IEC 61000-4-3 (RS) Level 4
		IEC 61000-4-4 (EFT) Level 4
		IEC 61000-4-5 (Surge)Level 3
		IEC 61000-4-6 (CS)Level 4
		IEC 61000-4-8 (M/S) Level 4

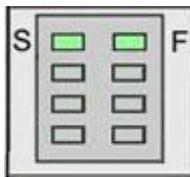

5.3 Hardware Interface

5.3.1 LED Indicators

LED	Description	Color	Status	Meaning
PWR	Power indicator	Red	ON	Power connection successful
			OFF	No power
SYS	System indicator	Green	ON	System is abnormal
			OFF	System is running normally
RUN	Running indicator	Green	Flashing	System is running normally
			OFF	System is abnormal

ERR	Error indicator	Red	ON	Northbound protocol connection error
			OFF	No errors
I/O RUN	I/O Running indicator	Green	Flashing	I/O module is working normally
			OFF	Module not inserted
I/O ERR	I/O Error indicator	Red	ON	I/O module communication error
			OFF	No errors

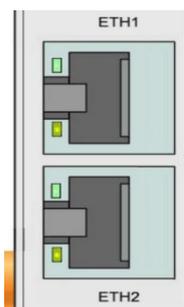

LED	Description	Color	Status	Meaning
S	System 24V power indicator	Green	ON	Power is OK
			OFF	No power
F	Field 24V power indicator	Green	ON	Power is OK
			OFF	No power

5.3.2 Ethernet Port

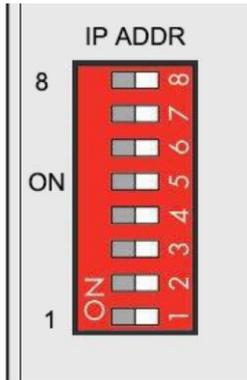

Connect to the Ethernet-based fieldbus through ETH2.

EHT1 is used to connect other nodes that need to be connected to the Ethernet.

5.3.3 IP Address Selection Switch

The 8-bit DIP switch is used to set the IP address. The encoding of DIP switches is done bit by bit, starting from DIP switch 1 with the least significant bit (2^0) to DIP switch 8 with the most significant bit (2^7), corresponding to decimal values: 0-255.

When the value of the DIP switch is 1111 1111 (decimal 255), the IP address is set according to the web page. The web page setting can specify the IP or set the automatic acquisition. When the web page is not set, the IP address is: 192.168.1.10
 When the value of the DIP switch is 0000 0000 – 1111 1110 (decimal 0-254), determine the 3rd byte of the IP address, and the 1st, 2nd and 4th bytes are fixed bytes, namely 192.168.xxx.253

5.4 Modbus Register Mapping

The internal register map of BL205 node consists of 2 parts, one part is the data map of digital input and output and analog input and output module, the address range is 1000...9999; the other part is the serial port module, the address range is 10000...49999

The state of digital and analog I/O modules can be determined or changed through the register map (Address 1000 ... 9999).

I/O Modules

Modbus address		Data type	Access type	Function code	Description
decimal	hex				
1000...1999	0x03 E8...0x07 CF	1 Bit	read/write	0x01/05/0F	Digital output
2000...2999	0x07 D0...0x0B B7	1 Bit	read	0x02	Digital input
3000...3999	0x0B B8...0x0F 9F	32 Bit Float	read	0x04	Analog input
4000...4999	0x0F A0...0X13 87	32 Bit Float	read/write	0x03/06/10	Analog output
5000...8999	0x13 88...0x23 27	32 Bit Unint	read/write	0x03/04/10	DI count value
9000...9999	0x23 28...0x27 0F	1 Bit	read	0x02	Module power-on status

Serial port module

Modbus address		Data type	Access type	Function code	Description
decimal	hex				
10000...19999	0x27 10...0x4E 1F	1 Bit	read/write	0x01/05/0F	Digital output
20000...29999	0x4E 20...0x75 2F	1 Bit	read	0x02	Digital input
30000...39999	0x75 30...0x9C 3F	16 Bit	read	0x04	Analog input
40000...49999	0x9C 40...0XC3 4F	16 Bit	read/write	0x03/06/10	Analog output

5.5 OPC UA Data Point Node Id

The Node Id for OPC UA defaults to NS=1; S=Modbus mapping address of the I/O data point (for example, the first DO module of the first DO module: NS=1; S=1000), custom OPC UA model Node Id can be customized.

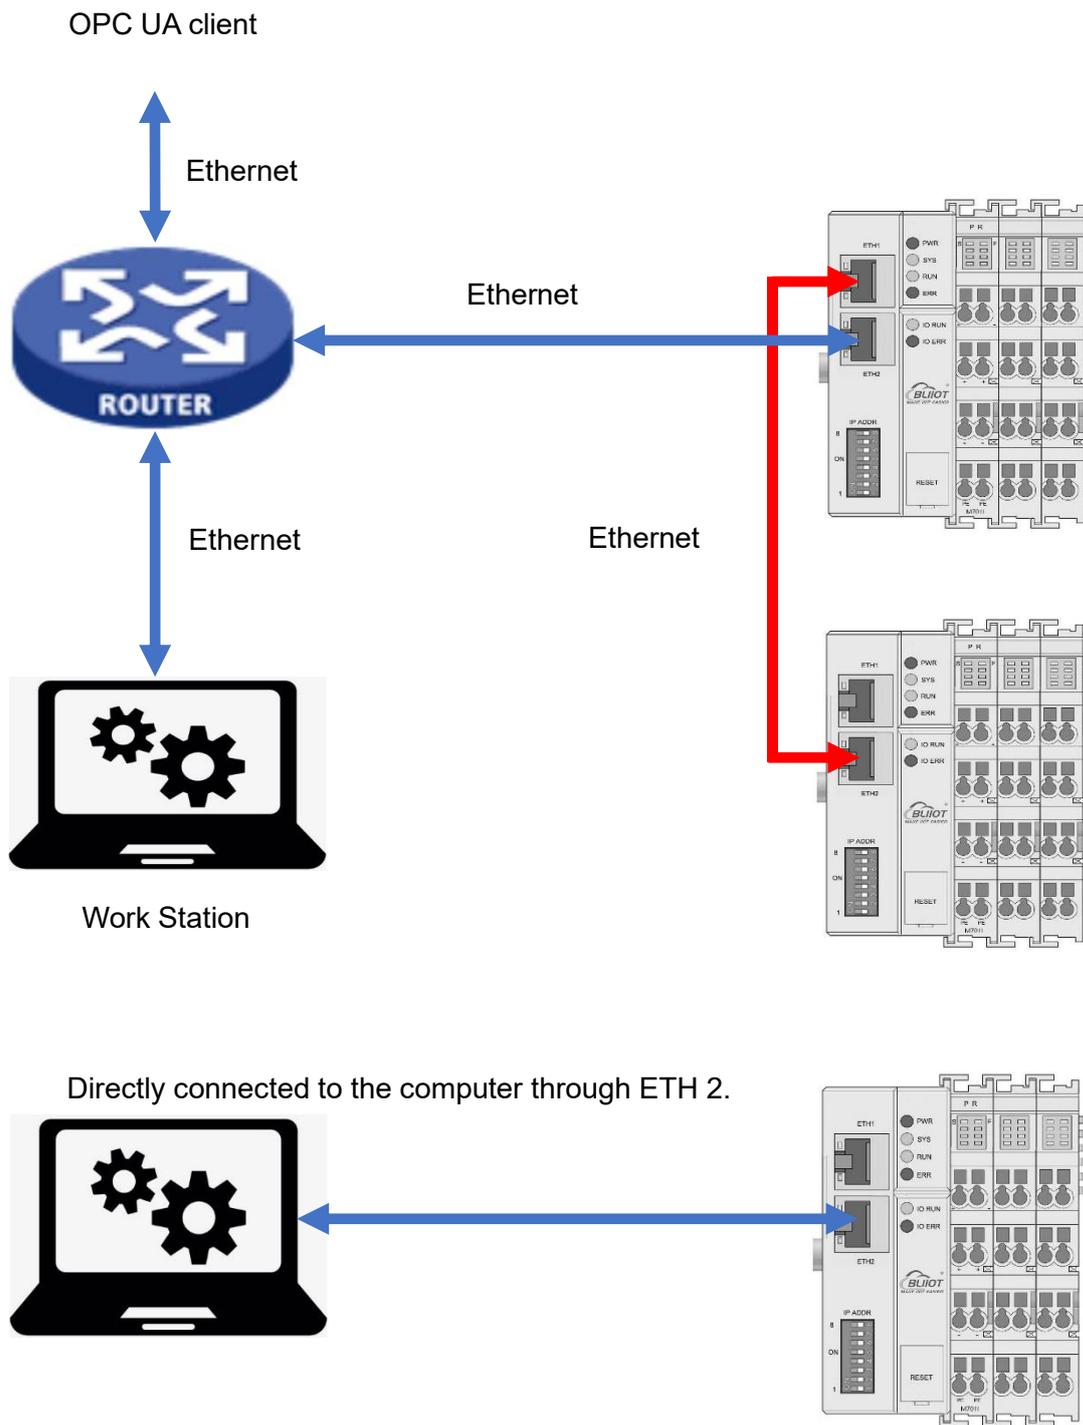

5.6 Controller Connection

The BL205 controller comes with 2 x RJ45 Ethernet ports, integrated switch function inside, work in store-and-forward operation mode, each port supports 10/100 Mbit transmission speed and full-duplex and half-duplex transmission mode.

The BL205 controller connect to the router Ethernet network via ETH2 only, while the EHT 1 is for connecting other nodes.

The internal integrated switch supports bypass mode, which can automatically start the bypass mode when the controller system fails, and automatically maintain the link between ETH1 and EHT2.

The wiring of these Ethernet ports conforms to the 100BaseTX specification, which specifies the use of category 5 twisted pair cable as the connecting cable. Cable types S/UTP (Screened unshielded twisted pair) and STP (shielded twisted pair) can be used up to a length of 100m.

5.7 Web Page Configuration

The BL205 OPC UA Coupler built-in web server is a browser-based configuration

utility. When the node is connected to your network, you can access the web console by entering the server's IP address in a web browser.

5.7.1 Preparation Before Configuration

To successfully access the BL205 controller, it must be properly installed and connected to the computer. In addition, configure them with correct IP addresses to keep them in the same network segment.

5.7.1.1 Connect Computer and Controller

1. Mount the fieldbus node on a DIN35 rail. Follow the installation instructions in the "Installation" chapter.
2. Connect the 24 V power supply to the system power terminals.
3. The computer and the bus node can be connected in two ways, one is that the two are connected to the switch device of the local area network through the Ethernet port; the other is that the two are directly connected point-to-point. For detailed steps, follow the instructions in the "Controller Connection" chapter.
4. Turn on the power supply and start supplying power.

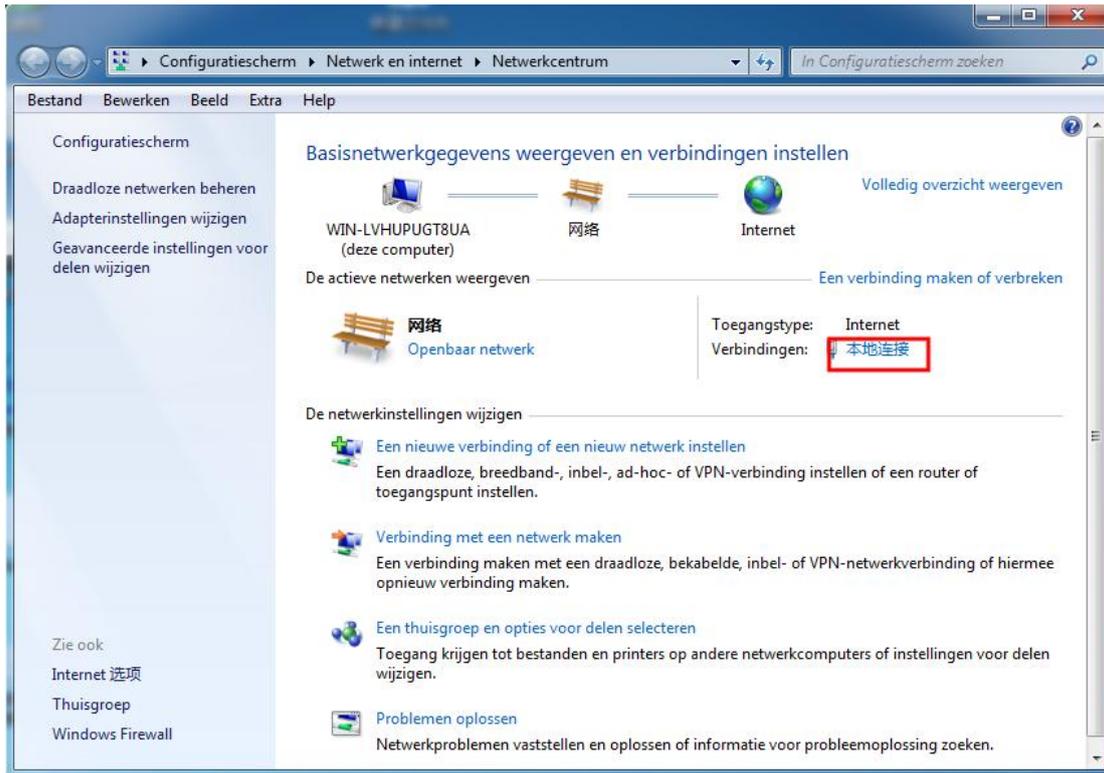

The controller is initialized after power-up, creates process image according to the I/O modules configuration of the fieldbus node.

5.7.1.2 Configure Computer IP Address

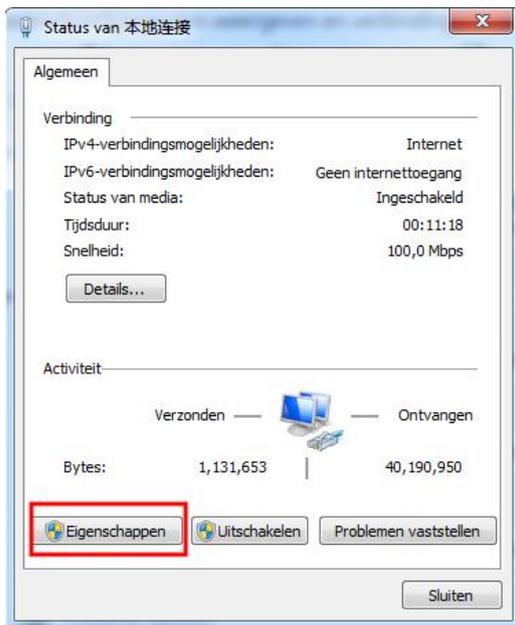

There are two ways to configure PC IP address. One is to turn on the automatic IP address option on the PC's local connection to dynamically assign DHCP in the network. The other is to configure a static IP address with the controller node on the same network segment on the local connection of the PC.

Takes Windows 7 system as an example for configuration. Windows systems are all configured similarly.

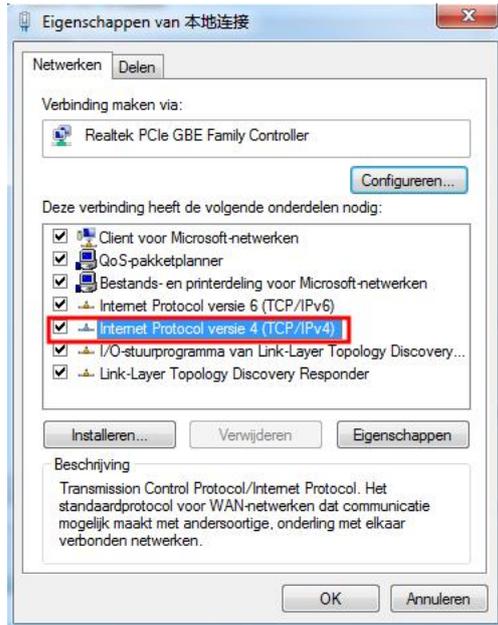

1. Click Start > Control Panel > Network and Sharing Center, and click local connection in the window that opens.

2. In the local connection status window, click Properties.

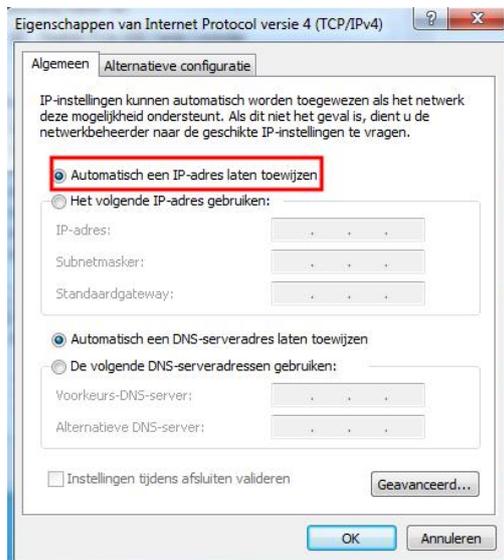

3. Double-click "Internet Protocol Version 4 (TCP/IPv4)" on the local connection properties page.

4. There are two ways to configure the IP address of the PC

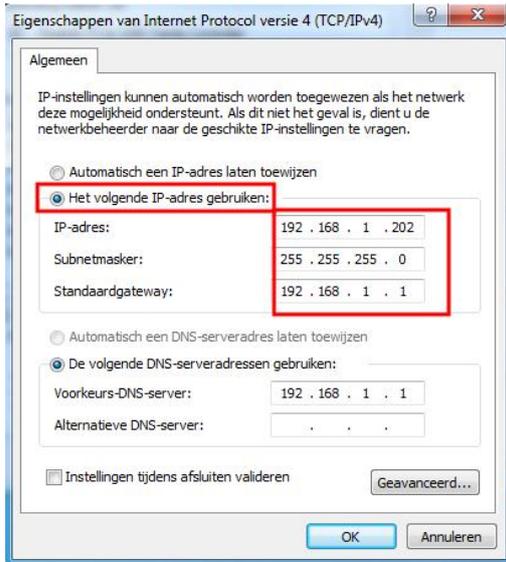

- Obtain IP address automatically (system default mode)

To obtain an IP address automatically from a DHCP server, select "Obtain an IP address automatically";

- Set a static IP address

Select "Use the following IP address" and set the correct values for the IP address, subnet mask and default gateway.

5.7.1.3 Configure Controller IP address

There are 2 ways to assign an IP address

- Assignment via built-in web page (static IP or automatic IP assignment)
- Assign via DIP switch (static IP)

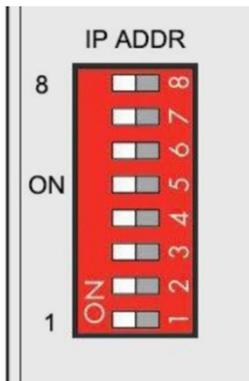

DIP address selector switch definition

Switch position (ON = 1)	Value	Definition
0000 0000 --- 1111 1110	0-254	Enable the DIP selector switch assignment function and determine the value of the 3rd byte. Example: 0010 0110 (22 decimal), the IP address is "192.168.22.253".
1111 1111	255	Enable the function of specifying IP on the web page, or select the function of DHCP automatic allocation. When the IP is not allocated through the web, the IP is 192.168.1.10.

5.7.1.3.1 Configuration via Web Page

The fieldbus coupler can be set to an IP address via the "Settings > Local Settings" page after entering the page, or it can be set to be assigned automatically. Select

static address, if not set IP address, the IP is 192.168.1.10

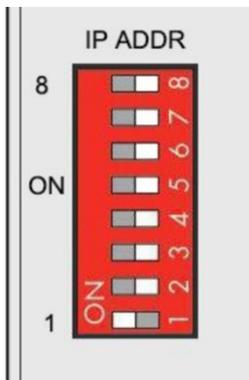

5.7.1.3.2 Assign IP via DIP Switch

Set the value of the DIP address selector switch to 0000 0000 - 1111 1110 (decimal 0 - 254), and the IP address will be assigned by the DIP switch.

The IP address consists of fixed bytes and variable bytes. The 1st, 2nd and 4th bytes are fixed bytes, the DIP selector switch determines the 3rd byte, namely:

192.168.xxx.253

The fieldbus coupler assigns an IP address via a DIP switch, and the IP address set in this way is static.

5.7.1.4 Factory Default Settings

Before logging into the web configuration page, it is necessary for you to understand the following default parameters,

Modbus TCP Server Port: 502, Modbus ID: 1

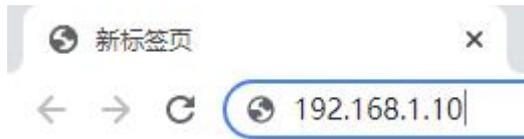

IP: Determined according to the DIP switch, if the DIP switch is 1111 1111, the default IP is 192.168.1.10

If factory default DIP switch is 0000 0000 status, then the IP is 192.168.0.253

Item	Description
Username	admin
Password	Empty

5.7.2 Login Configuration Page

1. Open a browser on your computer, such as IE, Chrome, etc.
2. Enter the IP address of the coupler node (192.168.1.10) in the address bar of the browser to enter the user login interface.

3. Enter "Username" and "Password" in the login interface, and then click Login.

5.8.2 System

5.8.2.1 System

System Properties > General Settings

The screenshot shows the 'System Properties > General Settings' page. A 'REFRESHING' button is in the top right. A sidebar menu is open, showing 'System' selected. The main content area has the following fields:

- Local Time:** 2022/3/21 下午2:58:56. Buttons: Sync with browser, Sync with NTP-Server.
- Hostname:** BL200UA
- Timezone:** UTC (dropdown menu)

At the bottom right, there are three buttons: 'Save & Apply', 'Save', and 'Reset'.

Item	Description	Default
Local time	Displays the current time of the device. You can click the "Sync browser time" or "Sync with NTP server" button to update the device time.	--
Hostname	The device name can be customized to easily distinguish between multiple devices.	BL200UA
Timezone	The time zone can be selected via the drop down menu	UTC

5.8.2.2 Administration

Administration > Router Password

Change the administrator password for accessing the device.

Shenzhen Beilai Technology Co.,Ltd (v1.0.11) / 2022-02-17

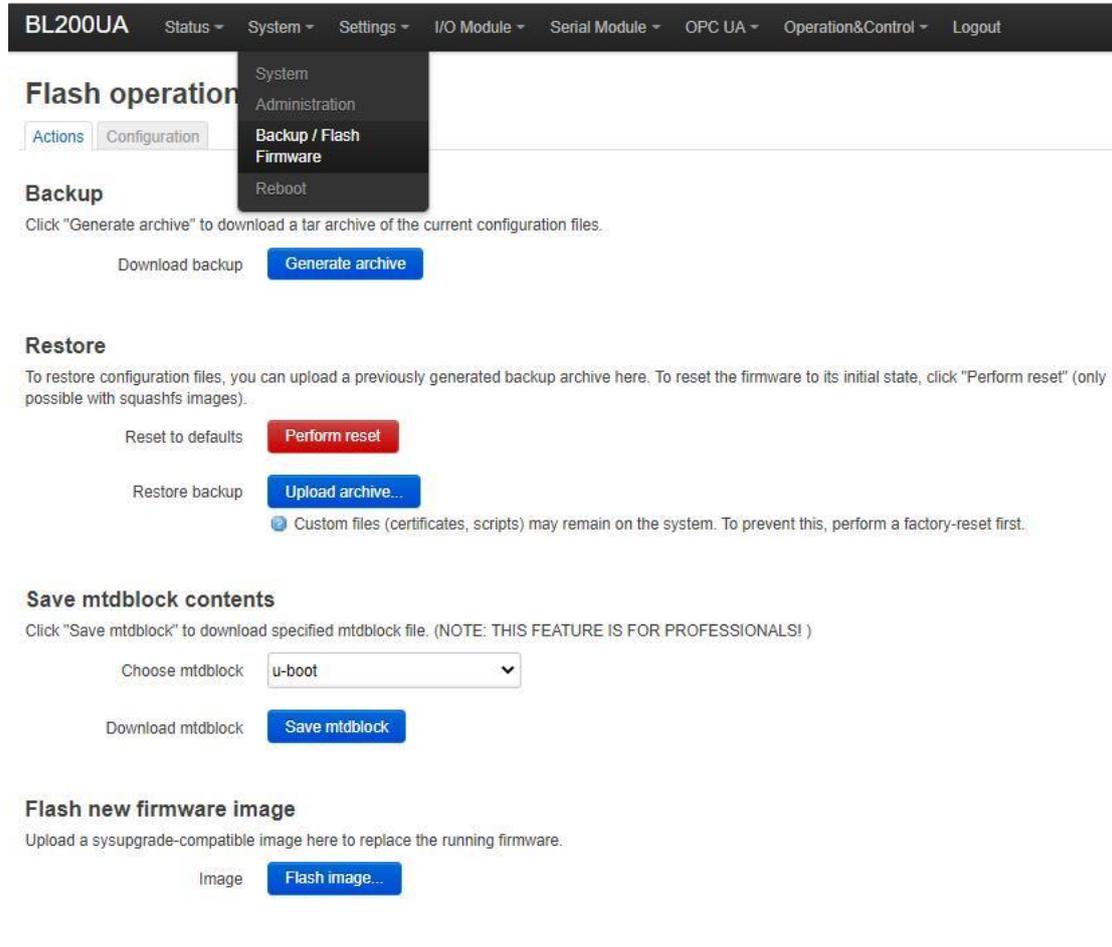

Administration > SSH Keys

Public keys allow for the passwordless SSH logins with a higher security compared to the use of regular passwords. In order to upload a new key to the device, paste an OpenSSH compatible public key line or drag a .pub file into the input field.

Shenzhen Beilai Technology Co.,Ltd (v1.0.11) / 2022-02-17

5.8.2.3 Backup/Flash Firmware

Flash operation

System
Administration
Backup / Flash Firmware
Reboot

Backup
Click "Generate archive" to download a tar archive of the current configuration files.
Download backup

Restore
To restore configuration files, you can upload a previously generated backup archive here. To reset the firmware to its initial state, click "Perform reset" (only possible with squashfs images).
Reset to defaults
Restore backup
Custom files (certificates, scripts) may remain on the system. To prevent this, perform a factory-reset first.

Save mtddblock contents
Click "Save mtddblock" to download specified mtddblock file. (NOTE: THIS FEATURE IS FOR PROFESSIONALS!)
Choose mtddblock:
Download mtddblock

Flash new firmware image
Upload a sysupgrade-compatible image here to replace the running firmware.
Image

Modbus Device ID	Modbus device ID range is 1~247.	1
Modbus TCP port	Modbus TCP protocol port number, which can be customized.	502
DIP switch address	Displays the IP address set by the DIP switch.	
IP address type	Select from "Static Address", "Dynamic Address(DHCP)".	
Set device IP address	The IP address of the device can be set by yourself, and it needs to be restarted to take effect after setting.	--

Subnet mask	Set IP subnet mask	
Gateway address	Set IP gateway address	

5.8.4 I/O Modules

After power on, the controller automatically recognizes all I/O modules connected to it and creates an internal local process image based on the module type, data width and the module's position in the node.

If I/O modules are added, changed or removed, a new process image is created and the process data addresses change. When adding an I/O module, the process data of all previous I/O modules must be considered.

The controller can connect up to 32 I/O modules, including digital input and output, analog input and output and special function modules.

Item	Description
Channels	Channel number of the digital output module

Modbus Address	Process map address of the digital output boolean data inside the controller
Value	Display the current output state, open: 0, close: 1
Power-on status	Set the state of DO after power-on, select from "open", "close", "last"
Open/Close	Can control the current channel output state

5.8.4.3 Analog Input Module

The analog input (AI) type module supports setting parameters through the controller web page, so that the data conversion is automatically realized inside the module, and the actual engineering value corresponding to the sensor can be directly output.

Shenzhen Beilai Technology Co.,Ltd (V1.1.12) / 2023-10-19

Item	Description
Channels	Channel number of the analog input module
Modbus Address	Process map address of the analog input module inside the controller
Value	Display the actual engineering value input by the current channel, 32-bit single-precision floating-point type
Mode	Different models of analog input modules have different options, please refer to the specific analog input I/O module manual for details.
Min Value	Sensor range minimum
Max Value	Sensor range maximum

Offset(mA)	The offset allows you to adjust the error between acquisition and actual.
------------	---

There is a linear relationship between the electrical signal value of the analog input module (usually a sensor) and the actual engineering value. Their formulas are as follows (take 4-20mA as an example):

$$\text{Actual engineering value} = (\text{current value} - 4) * ((\text{maximum} - \text{minimum}) / (20 - 4)) + \text{minimum}$$

Take the 4-20mA type water level sensor to measure the depth of the water tower as an example:

The known water level sensor range is 0-100m, the current data is 5.6mA, and the depth of the water tower is calculated:

Into the formula:

$$(5.6 - 4) * ((100 - 0) / (20 - 4)) + 0 = 10$$

The depth of the water tower is 10m

Polling period(s)
 If not set, the default is 0.2s

Response timeout(s)
 If not set, the default is 0.5s

Item	Description
Alias	Device nickname can be used to distinguish data
Slave Interface	Select serial channel
Slave address	Slave device address, range 1-247
Function code	Select according to the slave data type, including: "01", "02", "03", "04"
Register start address	Register start address of slave data
Data number	Number of slave data
Mapping address alloc	Support distribution method: auto According to different data types, the system automatically allocates down the starting address of the mapping, and the addresses are continuous. manual Manual allocation allows mapping addresses to be allocated across segments
Polling period (s)	The interval between two adjacent polling commands
Response timeout (s)	After sending the command to the slave, wait for the maximum time for the slave to return data. If the time exceeds this time, the slave will be considered to have no response.

You can modify, delete, and view data of slave, or you can disable collection.

Users can freely set various combination linkages between I/O (digital input and output, analog input and output) or serial port modules (Modbus slave data) according to needs. Whether the built logic is triggered can be judged according to the logic value item of the web page, "0" means not triggered, and "1" means triggered. Logical value items cannot be updated automatically, and the web page must be manually refreshed.

Example:

Logic 1 (And), input condition A and input condition B meet the trigger condition at the same time, output result Y.

Logic 2 (Or), any one of input condition C or input condition D satisfies the trigger condition, and the output result is Y.

Logic 3: Logic 1 + Logic 2 can be combined to form a logic 3 or more combinations.

Conditional operation is based on arithmetic operation plus condition triggering, that is, when the condition is satisfied, AI, AO or RS485 slave numerical type data or constants, these data can be free to choose 1-3 conditions for each other to "add, subtract, multiply or divide" arithmetic operation.

5.8.6.4 Example

✧ Take a simple packing system as an example

Requirements:

(1) After pressing the start button, the conveyor belt B starts to run first, and drags the empty box forward to the designated position. After reaching the designated position,

SQ2 sends a signal to stop the conveyor belt B from running.

(2) After the conveyor belt B stops, the conveyor belt A starts to run, and the products fall into the boxes one by one. The SQ1 sensor detects the products and detects that the products fall into the box. Conveyor belt A stops running, conveyor belt B starts running, and it goes on and on, until the stop button is pressed, and conveyor belts A and B stop at the same time.

To realize such a function in S7-200SMART, the peripheral wiring needs to use DI and DQ as follows:

Input		Output	
I0.0	Automatic control button	Q0.1	Conveyor A output
I0.1	Stop button	Q0.2	Conveyor B output
I0.2	B conveyor belt moving		
I0.3	A conveyor belt moving		
I0.4	SQ2 input		
I0.5	SQ1 input		

Using BL205 calculation and control simulation to achieve such requirements, the DI and DO required for wiring are as follows:

Input		Output	
DI1	A conveyor belt moving	DO1	Conveyor A output
DI2	B conveyor belt moving	DO2	Conveyor B output
DI3	Stop button		
DI4	Automatic control button		
DI5	Detect empty box sensor, SQ2 input		
DI6	Detect product SQ1 input		

5.8.6.4.1 Bool Logic Configuration Example

Logical operation - Achuansongdai

Input1:

Condition:

Relationship:

Output Type:

Output Address: ✖

Bool Value:

Output Delay(ms):

Set Default:

[Dismiss](#) [Save](#)

Steps:

- (1) Enter Achuansongdai, click Add, and the configuration box will pop up.
- (2) Enter 1: Select DI1 register REG2000.
- (3) Condition: Select Close.

- (4) Relationship: Select "None", because DI1 directly controls the operation of A conveyor belt, so select "None" because there are no other conditions.
- (5) Output type: Select Bool type, because DO1 control is Bool.
- (6) Output address: REG1000, DI1 only controls one DO1, so only select the DO1 register address, if DI controls multiple registers, you can select multiple registers. As in the third logic "tingzi", press the stop button, both conveyor belts A and B stop.
- (7) Bool value: Off, DI1 controls DO1 to close, so choose to close.
- (8) Output delay (milliseconds): Since it is a timely response and no delay is required, leave it blank.
- (9) Set default: When the selection logic is not established, whether DO1 restores the default state, select according to the requirements.
- (10) Click "Save".
- (11) Follow the same steps to build other logic.
- (12) Click "Save and Apply" to write into the BL205 controller.

5.8.6.4.2 Numerical Logic Configuration Example

The AI1 register REG3000 is connected to the temperature sensor to monitor the temperature of the motor. When the collected temperature is greater than 50, the fan is turned on, and the fan is controlled by the DO3 register REG1002.

Numerical Logic

Name	Input1	Condition	Threshold	Relationship	Input2	Condition	Threshold	Output Address	Output Value	Logic Value	
wendu	REG3000	Greater Than	50	None	none	none	none	REG1002	close	0	<input type="button" value="Edit"/> <input type="button" value="Delete"/>
<input style="width: 100px; height: 20px;" type="text"/> <input type="button" value="Add"/>											

Logical operation - wendu

Input1: REG3000

Condition: Greater Than(>)

Threshold: 50

Relationship: None

Output Type: Bool Type

Output Address: REG1002

Bool Value: Close

Output Delay(ms):

Set Default:

Similarly, numerical logic and Bool logic have the same logic principle. Numerical logic only judges that the condition is "greater than", "less than" or "equal to" a certain value as a linkage condition.

5.8.6.4.3 Combinational Logic Example

The conveyor belt is not running, the temperature of the motor exceeds 50 degrees, the fan is turned on, and the alarm DO4 register REG1003 is triggered.

Combinational logic

Name	Input1	Condition	Relationship	Input2	Condition	Output Address	Output Value	Logic Value	
bj	zidongB	Is false	Logic And	wendu	Is true	REG1003	close	0	<input type="button" value="Edit"/> <input type="button" value="Delete"/>

Steps:

- (1) In the Combinational Logic item, input the name "bj", click Add, and the configuration box will pop up.
- (2) Input 1: Select the logic name "zidongB" built in Bool logic before, you can choose Bool logic or numerical logic according to your demand.
- (3) Condition: Select "Is false", according to your demand, whether the logic selected by input 1 is triggered or not as a condition.
- (4) Relationship: Select "Logic And" to choose, according to your demand, the logical relationship between condition 1 and condition 2, you can also select "no" condition 2.
- (5) Input 2: Select the logic name "wendu", choose Bool logic or numerical logic according to your demand.
- (6) Condition: Select "Is true", according to your demand, whether the logic selected by input 2 is triggered or not as a condition.
- (7) Output Type: Select "Bool Type", select Bool or numeric data according to "Output Address".
- (8) Output address: Select the register address to be operated. DO4 register REG1003.
- (9) Bool value: Close, DO4 closed to control the alarm
- (10) Output delay (milliseconds): It is a timely response, there is no need for a delay, so do not fill in.
- (11) Set default: Choose whether to restore the default state of DO4 when the logic is not valid, according to your demand.

- (12) Click "Save".
- (13) Click "Save and Apply" to write into BL205 controller.

5.8.6.4.4 Arithmetic Operation Configurations

The sensor collects the quantity produced in a day and stores it in register REG40002, and through the arithmetic function it calculates the quantity produced in each hour of an 8-hour day and stores it in register REG40004, and the data in register REG40004 can be sent to your platform or server through OPC UA .

- (3) Operation: Select "/", you can select "add, subtract, multiply and divide" here

according to your demand.

(4) Input 2: Select Constant, you can select other register address according to your demand.

(5) Input 2: Fill in the constant because constant is selected, when select a register, there is no such item.

(6) Operation: According to whether there is also a condition 3 selection, if not, then it doesn't matter.

(7) Input 3: Select "none", because there is no need for this condition option, you can also choose registers, constants, none.

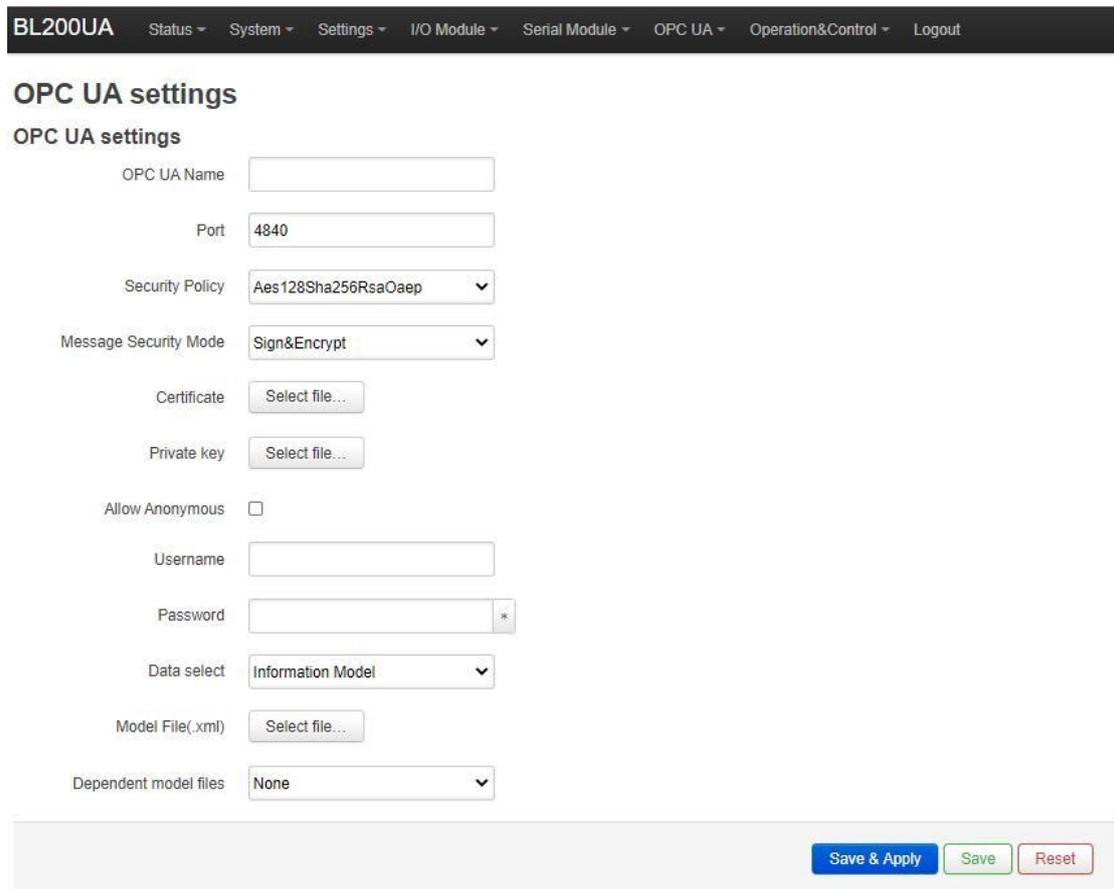

(8) Output Address: Select the register address to store the result of the operation.

(9) Click "Save".

(10) Click "Save and Apply" to write into the BL205 controller.

5.8.7 OPC UA

After configuring the OPC UA parameters, click "Save and Apply" to send them to the BL205 controller to take effect.

The screenshot shows the web interface for configuring OPC UA settings on a BL200UA controller. The navigation bar at the top includes: BL200UA, Status, System, Settings, I/O Module, Serial Module, OPC UA, Operation&Control, and Logout. The main heading is "OPC UA settings". The configuration fields are as follows:

- OPC UA Name:
- Port:
- Security Policy:
- Message Security Mode:
- Certificate:
- Private key:
- Allow Anonymous:
- Username:
- Password:
- Data select:
- Model File(.xml):
- Dependent model files:

At the bottom right, there are three buttons: "Save & Apply" (blue), "Save" (green), and "Reset" (red).

Item	Description	Default
OPC UA name	OPC UA server name	
Port	OPC UA server port number	4840
Security policy	None basic128rsa15 basic256 basic256sha256 aes128sha256rsaoaep All security policies	None
Message security mode	Sign Sign and encrypt	
Certificate	OPC UA certificate, click the uploaded certificate to load the configuration page.	
Private key	OPC UA private key, click on the uploaded certificate to load it into the configuration page.	
Allow anonymous	Whether to enable user name and password login	
Username	Fill in the username	
Password	Fill in password	
Data select	All data Select data point Information model	All data
Select data point	You can select the data points you want to read. "Data selection" option to select "select data point" to have this option	
Model file (.xml)	Upload the information model (.xml) file, select "Information Model" in the "Data Selection" item to have this option	
Dependent model files	Select the number of information models to reference, up to 5 can be selected.	
Dependent Models 1-5	Upload the information model (.xml) file to be referenced	

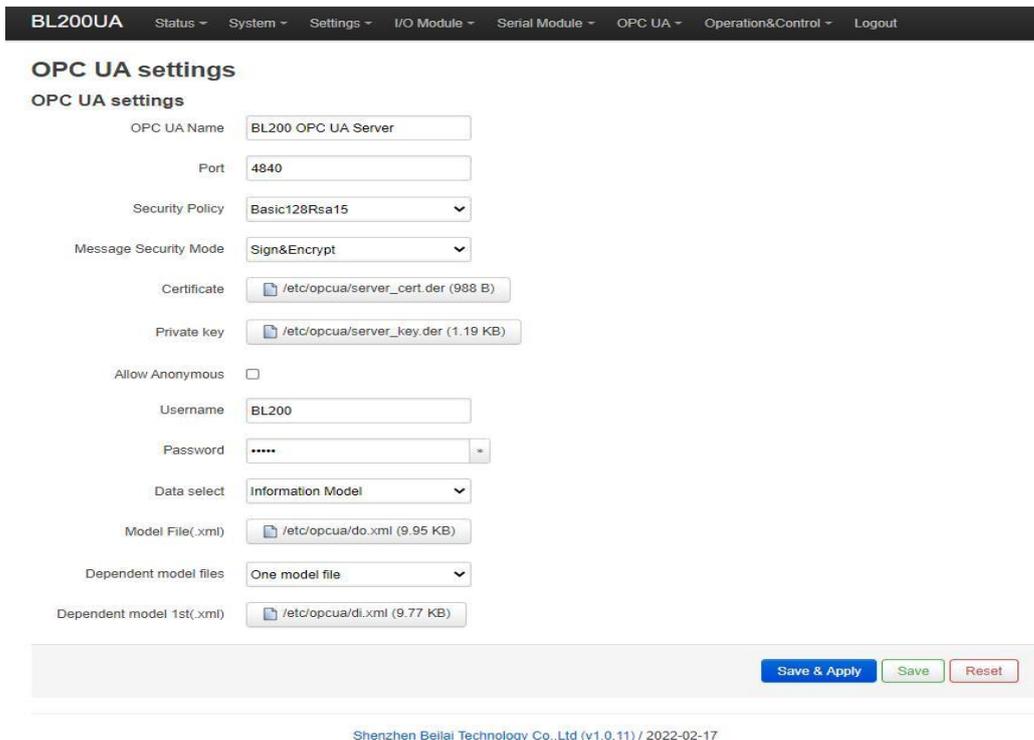

Note: For a customized information model, the data point description item must be in the format of REG + Modbus address during modeling. For example, DO1 point description item fills in REG1000, and other items are customized.

6 BL205 Communication Example

6.1 Communication Between UaExpert and BL205

The BL205 collects DI, DO, and AI modules, selects basic128rsa15 as a security policy, and selects a signature and encryption method. The data format is based on a custom information model. Take an information model as an example. The data can also be uploaded directly according to the format of our company. For the definition of each configuration, please refer to chapter 5.8.7 OPC UA.

6.1.1 OPC UA Web Page Configuration

BL200UA Status - System - Settings - I/O Module - Serial Module - OPC UA - Operation&Control - Logout

OPC UA settings

OPC UA settings

OPC UA Name: BL200 OPC UA Server

Port: 4840

Security Policy: Basic128Rsa15

Message Security Mode: Sign&Encrypt

Certificate: /etc/opcua/server_cert.der (988 B)

Private key: /etc/opcua/server_key.der (1.19 KB)

Allow Anonymous:

Username: BL200

Password:

Data select: Information Model

Model File(.xml): /etc/opcua/do.xml (9.95 KB)

Dependent model files: One model file

Dependent model 1st(.xml): /etc/opcua/di.xml (9.77 KB)

Save & Apply Save Reset

Shenzhen Beilai Technology Co.,Ltd (v1.0.11) / 2022-02-17

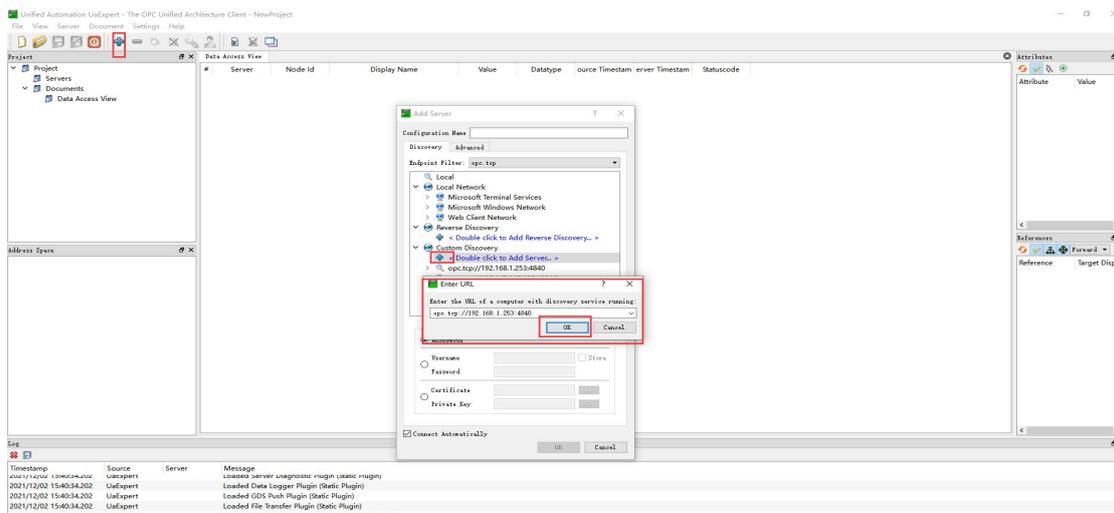

Steps:

- (1) Fill in the OPC UA name, which can be customized to facilitate the OPC UA client to search and distinguish different OPC UA servers. For example: fill in "BL200 OPC UA Server".
- (2) The port number of the OPC UA server, default: 4840.
- (3) Security policy selection. For example, choose basic128rsa15.
- (4) Message security mode selection. For example, choose Signing and Encryption.

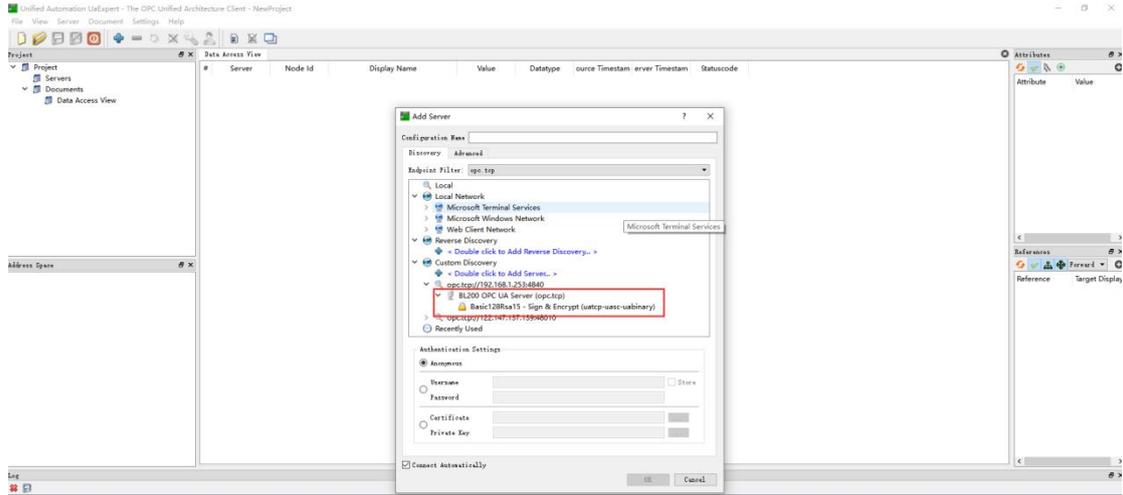

- (5) Upload the certificate and key, click "Select File" > click "Upload File" > select your certificate or key file, click Open > After it is displayed in the file name box, click Upload file > After uploading the file successfully The file you uploaded will be displayed in the box, click the certificate or key file you uploaded > then your certificate or key file will be displayed in the certificate or key item.
- (6) Whether to allow anonymity, because of the use of signature and encryption methods, allow anonymity is not checked.
- (7) Fill in the username and password. The client needs to fill in the username and password when connecting.
- (8) Select the data, because the user-defined information model is used, so choose the "information model".
- (9) Upload the information model file. The upload method is the same as uploading the certificate or key file. The uploaded file is an xml file.
- (10) Depends on the model file, whether there is a reference model, and how many references are there.
- (11) Dependent model: Upload the model you refer to. The upload method is the same as uploading the certificate or key file. The upload is an xml file.
- (12) Click "Save and Apply".

6.1.2 Send and Receive Data Using UaExpert Client

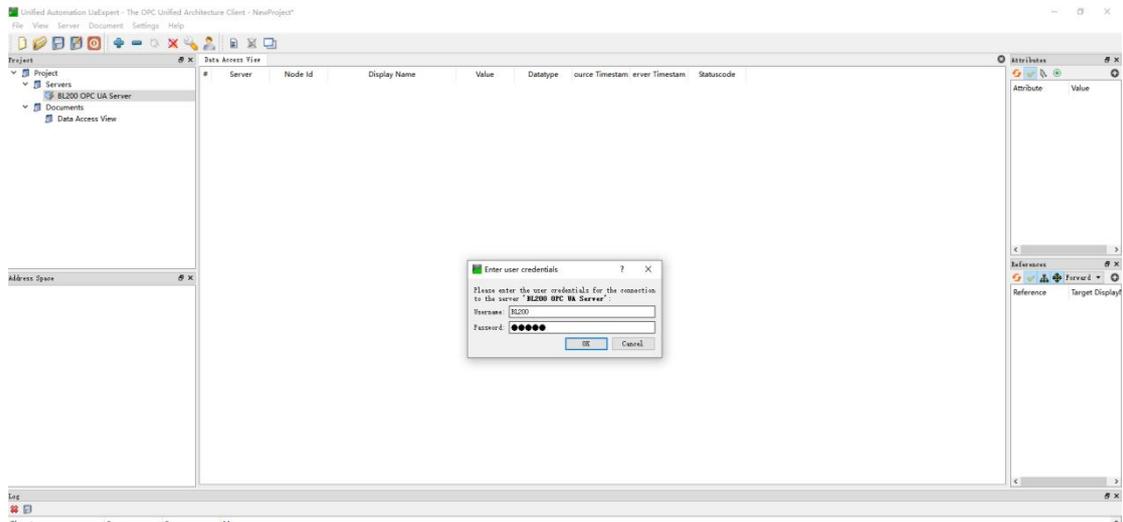

Open UaExpert (OPC UA client) and enter the OPC UA server IP and port.

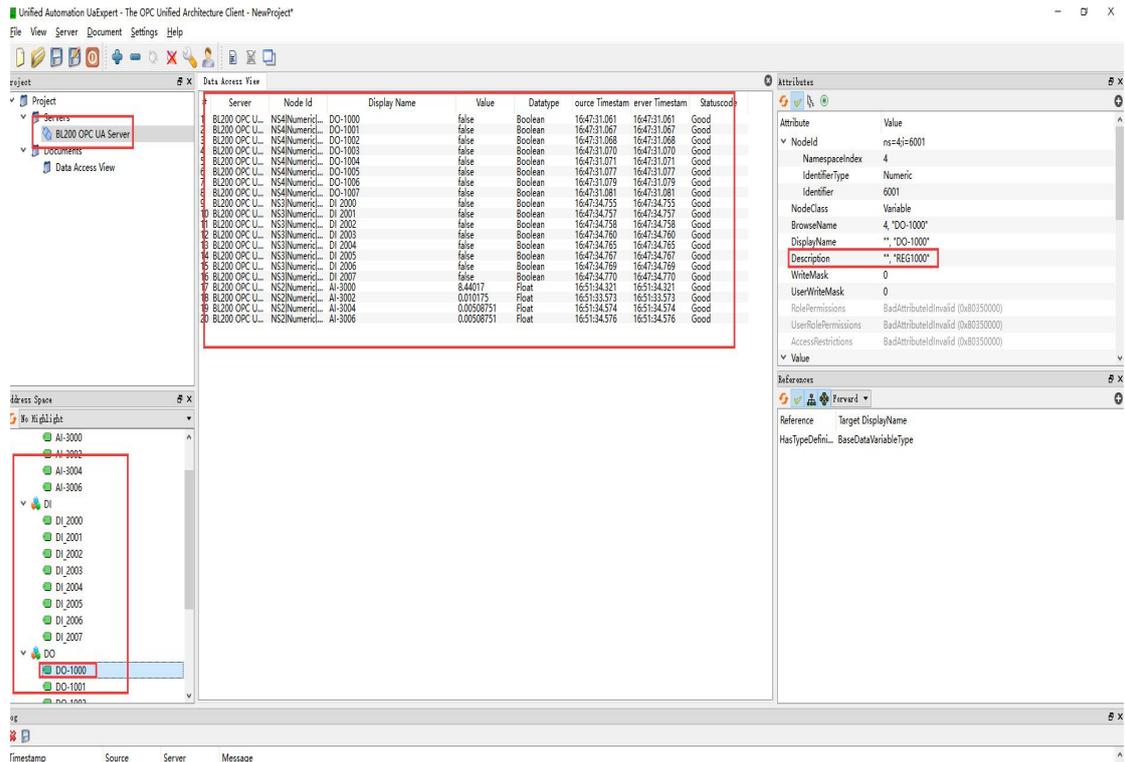

Click Search, click the searched OPC UA server, and click basic128rsa15 for Signature and Encryption.

Enter the set username and password

The collected data is as follows:

The description item of the custom information model data point must be REG+Modbus address, as shown in the description of the DO-1000 point in the figure above.

OPC UA client data delivery

Take the following data point DO-1000 as an example

Shenzhen Beilai Technology Co.,Ltd (v1.0.11) / 2022-02-17

Click the value of the DO-1000 data point, it turned out to be false, there is no √ in the square, click once to put √, click the left mouse button in the blank space or press the [Enter] key on the keyboard.

The OPC UA client will send a message successfully. Because the server responds quickly, you can see that the value has changed to "true".

The screenshot shows the UaExpert interface with a 'Data Access View' table and a 'Log' window. The table lists various nodes and their values, with DO-1000 highlighted in red. The log shows a successful write operation to node NS4(Numeric)6001.

#	Server	Node Id	Display Name	Value	Datatype	Source Timestamp	Server Timestamp	Statuscode
1	BL200 OPC U.L.	NS4(Numeric)DO-1000	DO-1000	true	Boolean	165922729	165922729	Good

Log Message: 2021/12/02 16:59:23.065 DA Plugin BL200 OPC U.L. Write to node NS4(Numeric)6001 succeeded [ret = Good (0x00000001)]

Check the DO status in the web configuration of BL205. DO1 is also changed from the original open to close.

The screenshot shows the web configuration interface for BL200UA. The 'IO status' table is highlighted, showing the status of various IO modules. The DO module (M2082) is highlighted with a red box, indicating its status has changed.

IO Slot	Module Name	Module Type	Channel Number	Modbus Address	24V Address-State	Soft Version	IO Status	Channel Status
1	M1081	DI	8	2000-2007	9001-Power Off	5	Normal	Channel Status
2	M2082	DO	8	1000-1007	9002-Power Off	5	Normal	Channel Status
3	M3041	AI	4	3000-3006	9003-Power Off	5	Normal	Channel Status
4	M4044	AO	4	4000-4006	9004-Power Off	5	Normal	Channel Status
5	M6021	COM	2	0-0	9005-Power Off	5	Normal	Channel Status

IO status

IO Slot:2,Module Type:DO,Module Name:M2082

Channels	Modbus Address	Value	PowerOn Status	Open/Close
